

## Source

Influenza A [Wisconsin/588/2019(H1N1)] Neuraminidase (NA) Protein, His Tag (NEE-V524k) is expressed from human 293 cells (HEK293). It contains AA Val 80 - Lys 469 (Accession # EPI\_ISL\_404527, GISAID).

Predicted N-terminus: His

## Molecular Characterization

Poly-his Neuraminidase (NA)(Val 80 - Lys 469)  
EPI\_ISL\_404527

This protein carries a polyhistidine tag at the N-terminus.

The protein has a calculated MW of 50.8 kDa. The protein migrates as 60-65 kDa when calibrated against [Star Ribbon Pre-stained Protein Marker](#) under reducing (R) condition (SDS-PAGE) due to glycosylation.

## Endotoxin

Less than 1.0 EU per µg by the LAL method.

## Purity

>90% as determined by SDS-PAGE.

## Formulation

Supplied as 0.2 µm filtered solution in 50 mM Tris, 300 mM NaCl, pH 7.5 with trehalose as protectant.

Contact us for customized product form or formulation.

## Shipping

*This product is supplied and shipped with dry ice, please inquire the shipping cost.*

## Storage

*Please avoid repeated freeze-thaw cycles.*

This product is stable after storage at:

- The product MUST be stored at -70°C or lower upon receipt;
- -70°C for 3 months under sterile conditions.

## SDS-PAGE

Influenza A [Wisconsin/588/2019(H1N1)] Neuraminidase (NA) Protein, His Tag on SDS-PAGE under reducing (R) condition. The gel was stained with Coomassie Blue. The purity of the protein is greater than 90% (With [Star Ribbon Pre-stained Protein Marker](#)).

## Bioactivity-ELISA

Discounts, Gifts,  
and more!

**Influenza A [Wisconsin/588/2019(H1N1)] Neuraminidase (NA) Protein, His Tag ELISA**  
0.1 µg of Influenza A [Wisconsin/588/2019(H1N1)] Neuraminidase (NA) Protein, His Tag per well

Immobilized Influenza A [Wisconsin/588/2019(H1N1)] Neuraminidase (NA) Protein, His Tag (Cat. No. NEE-V524k) at 1 µg/mL (100 µL/well) can bind Anti-NA(A/PAN) Mouse IgG with a linear range of 0.2-4 ng/mL (QC tested).

## Background

Neuraminidase (N) and hemagglutinin (HA) are major membrane glycoproteins found on the surface of influenza virus. Hemagglutinin binds to the sialic acid-containing receptors on the surface of host cells during initial infection and at the end of an infectious cycle. Neuraminidase, on the other hand, cleaves the HA-sialic acid bondage from the newly formed virions and the host cell receptors during budding. Neuraminidase thus is described as a receptor-destroying enzyme which facilitates virus release and efficient spread of the progeny virus from cell to cell.
